Teamstudio® Agent Registry

Real-time agent monitoring

- Gain a 360-degree view of all agent activity on your servers
- Identify—and resolve—agent errors before they happen
- Optimize server performance by keeping abreast of agent activity
- View details of past and scheduled agent activity
- Capture all run-time info and track outcomes automatically

Agents are everywhere. They toil quietly in the background, automating repetitive tasks, running scheduled events, and facilitating the general workflow in countless ways. But their very pervasiveness—and the difficulty of seeing exactly what they're up to (or not up to)—can have serious repercussions.

Teamstudio Agent Registry mitigates that risk. It lets administrators see into all the dark corners of their Notes®/Domino® environment. Agent Registry makes all agent activity visible, trackable, and ultimately more manageable and secure.

Agents without secrets

Agent Registry scans your server and collects the settings of each and every Notes agent it finds. It can display this information in a variety of views in order to reveal key details such as the server to run the agent on, the agent signer, and when the agent is scheduled to run. It continues to record when agents run and what their actions were. It can record what databases and documents an agent opened, and what errors the agent encountered. It can also send an email if an agent does not finish.

Native tools aren't up to the task

Without Agent Registry, administrators have limited ability to monitor agent activity. Notes' Agent Manager records basic pass/fail information in the server console log file, but the log file doesn't indicate when the event was scheduled, where it ran, what it did, or who signed permission for the agent to run. By collecting all this information and presenting it in a coherent way, Agent Registry makes debugging agents or configuration issues a far simpler task.

Domino tools like Domino Domain Monitoring (DDM) and Events are useful mechanisms for alerting an administrator when certain events take place, but they cast a net so wide that it is difficult to pinpoint agent problems. In addition, they cannot detect when agents fail due to coding or logic errors.

Improve server performance and reduce security risks

When agents are allowed to run unchecked, server performance can be compromised. Worse still, system-wide security can be put at risk. Agent Registry enables administrators to avoid these consequences. By providing a 360 degree view of all agent activity and verifying the permissions associated with each, Agent Registry gives administrators the ability to nab "rogue" agents, weed out obsolete programs cluttering the server, and ensure that agents have the proper authorization to perform their function.
